

Prevent High Risk Data Loss Before It Gets Out The Door

Distracted end users are dangerous.

If your company has employees, uses email, and handles or houses any important information, a detrimental outbound data breach could be right around the corner. Traditional Data Loss Prevention (DLP) solutions have limited functionality. Some only quarantine messages, others bounce them back as undeliverable, a few block the messages entirely, and none of them can support your organization's mobile devices.

82%

of data breaches involve the human element, whether by theft, misuse, or error.

72%

of departing employees admit to taking company data.

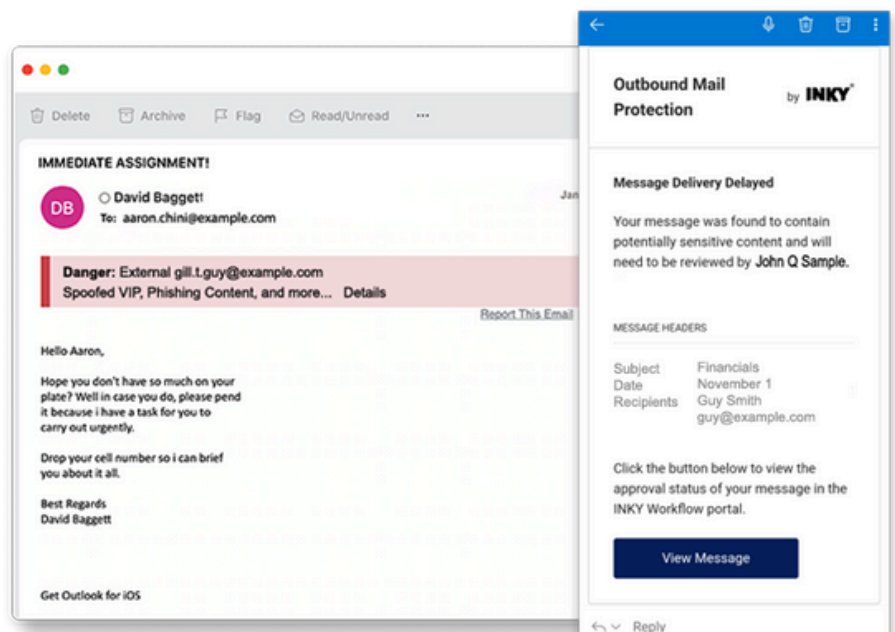

70%

of intellectual property theft occurs 3 months before an employee resigns.

Outbound Mail Protection is different.

Using a combination of detection modules to identify instances of sensitive data in messages, Outbound Email Protection cross-referencing multiple data points including keywords and variable contextual clues in a message, pattern matching, and various data types. You're notified when sensitive data - such as credit cards and bank account routing numbers - is found.

OUTBOUND MAIL PROTECTION

You set the rules.

Once sensitive data is identified, your predetermined workflow or approval process kicks in. Notifications are delivered— one to the sender educating them their outbound email requires approval, and one to the approver notifying them a review is required. After that review is completed and the decision is implemented, and the outcome is shared with the sender.

Real-time Security Training

Clearly explains why a review is required, serving up training just when you need it.

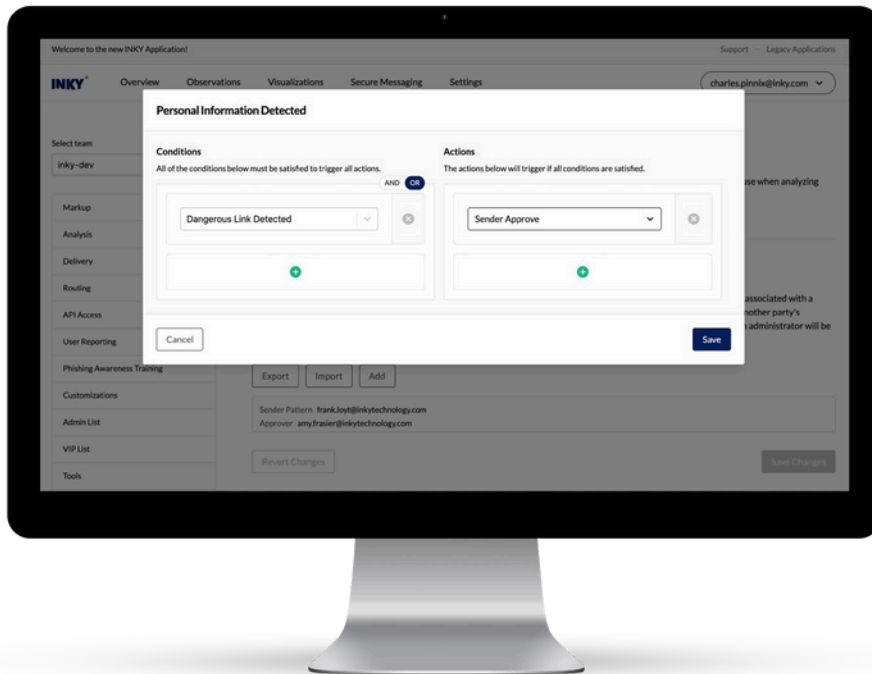

Productivity Supercharged

Notifies instantly when approval is needed, and action happens inside the email.

Any Device, Any Time

Works the same across all devices including cell phones and tablets.
